

SOLUTIONS SHEET 4

YANNIS BÄHNI

Remark: We will abbreviate $\mathbb{C}^\times := \mathbb{C} \setminus \{0\}$.

Exercise 1.

(a) We use the quotient criterion [RS02, p. 100]. Consider the sequence

$$a_\nu := \frac{\nu!}{2^\nu(2\nu)!} \quad \nu \in \mathbb{N}_{>0}. \quad (1)$$

Clearly $a_\nu \neq 0$ for all $\nu \in \mathbb{N}_{>0}$. We have

$$\begin{aligned} \lim_{\nu \rightarrow \infty} \frac{|a_\nu|}{|a_{\nu+1}|} &= \lim_{\nu \rightarrow \infty} \frac{\nu!}{2^\nu(2\nu)!} \frac{2^{\nu+1}(2(\nu+1))!}{(\nu+1)!} \\ &= \lim_{\nu \rightarrow \infty} \frac{2(2\nu+1)(2\nu+2)}{\nu+1} \\ &= 4 \lim_{\nu \rightarrow \infty} (2\nu+1) \\ &= \infty \end{aligned}$$

Thus by

$$\lim_{\nu \rightarrow \infty} \frac{|a_\nu|}{|a_{\nu+1}|} = \limsup_{\nu \rightarrow \infty} \frac{|a_\nu|}{|a_{\nu+1}|} = \liminf_{\nu \rightarrow \infty} \frac{|a_\nu|}{|a_{\nu+1}|} \quad (2)$$

and

$$\liminf_{\nu \rightarrow \infty} \frac{|a_\nu|}{|a_{\nu+1}|} \leq R \leq \limsup_{\nu \rightarrow \infty} \frac{|a_\nu|}{|a_{\nu+1}|} \quad (3)$$

we get

$$R = \infty. \quad (4)$$

(b) We use the Cauchy-Hadamard formula [RS02, p. 99]. Let $c \in \mathbb{C}^\times$. Consider the sequence

$$a_\nu := \begin{cases} \frac{1}{c^{\nu/2}} & \nu \equiv 0 \pmod{2} \\ 0 & \nu \equiv 1 \pmod{2} \end{cases}$$

Since $0 \leq 1/|c|^{\nu/2}$ we get

$$\limsup_{\nu \rightarrow \infty} |a_\nu|^{1/\nu} = \lim_{\nu \rightarrow \infty} \sup_{\mu \geq \nu} \{|a_\mu|^{1/\mu}\}$$

(Yannis Bähni) UNIVERSITY OF ZURICH, RÄMISTRASSE 71, 8006 ZURICH
E-mail address: yannis.baehni@uzh.ch.

$$\begin{aligned}
&= \lim_{\nu \rightarrow \infty} \sup_{\substack{\mu \geq \nu \\ \mu \equiv 0 \pmod{2}}} \{|a_\mu|^{1/\mu}\} \\
&= \lim_{\nu \rightarrow \infty} \sup \left| \frac{1}{c^\nu} \right|^{1/(2\nu)} \\
&= \lim_{\nu \rightarrow \infty} \sup \frac{1}{\sqrt{|c|}} \\
&= \lim_{\nu \rightarrow \infty} \frac{1}{\sqrt{|c|}} \\
&= \frac{1}{\sqrt{|c|}}
\end{aligned}$$

and therefore

$$R = \frac{1}{\limsup_{\nu \rightarrow \infty} |a_\nu|^{1/\nu}} = \sqrt{|c|}. \quad (5)$$

Exercise 2. Proof by induction over $k \in \mathbb{N}$. If $k = 0$ we have

$$\sum_{\nu=0}^{\infty} \binom{\nu}{0} z^\nu = \sum_{\nu=0}^{\infty} z^\nu = \frac{1}{1-z} \quad (6)$$

by the well-known identity for the geometric series (see [RS02, p. 24]) which holds for all $z \in \mathbb{E}$. Now assume the stated identity is true for some $k \in \mathbb{N}$. Pascal's identity and the substitution $\mu := \nu - 1$ yields

$$\begin{aligned}
\sum_{\nu=k+1}^{\infty} \binom{\nu}{k+1} z^{\nu-(k+1)} &= 1 + \sum_{\nu=k+2}^{\infty} \binom{\nu}{k+1} z^{(\nu-1)-k} \\
&= 1 + \sum_{\nu=k+2}^{\infty} \left[\binom{\nu-1}{k} + \binom{\nu-1}{k+1} \right] z^{(\nu-1)-k} \\
&= 1 + \sum_{\nu=k+2}^{\infty} \binom{\nu-1}{k} z^{(\nu-1)-k} + \sum_{\nu=k+2}^{\infty} \binom{\nu-1}{k+1} z^{(\nu-1)-k} \quad (7) \\
&= \binom{k}{k} z^0 + \sum_{\mu=k+1}^{\infty} \binom{\mu}{k} z^{\mu-k} + \sum_{\mu=k+1}^{\infty} \binom{\mu}{k+1} z^{\mu-k} \\
&= \sum_{\mu=k}^{\infty} \binom{\mu}{k} z^{\mu-k} + z \sum_{\mu=k+1}^{\infty} \binom{\mu}{k+1} z^{\mu-k-1}
\end{aligned}$$

Applying the induction hypothesis on (7) and rearranging yields

$$\sum_{\nu=k+1}^{\infty} \binom{\nu}{k+1} z^{\nu-(k+1)} = \frac{1}{(1-z)(1-z)^{k+1}} = \frac{1}{(1-z)^{k+2}}. \quad (8)$$

Therefore we conclude by the principle of induction.

A more elegant proof can be deduced from the interchangeability of differentiation and summation of power series (see [RS02, p. 110]).

Lemma 0.1. *For $z \in \mathbb{E}$ and $k \in \mathbb{N}$ we have*

$$\frac{d^k}{dz^k} \frac{1}{1-z} = \frac{k!}{(1-z)^{k+1}}. \quad (9)$$

Proof. Proof by induction over $k \in \mathbb{N}$. The statement obviously holds for $k = 0$. Assume the statement holds for $k \in \mathbb{N}$. Then we get

$$\begin{aligned} \frac{d^{k+1}}{dz^{k+1}} \frac{1}{1-z} &= \frac{d}{dz} \left[\frac{d^k}{dz^k} \frac{1}{1-z} \right] \\ &= \frac{d}{dz} \frac{k!}{(1-z)^{k+1}} \\ &= k! \frac{(k+1)(1-z)^k}{(1-z)^{2k+2}} \\ &= \frac{(k+1)!}{(1-z)^{k+2}}. \end{aligned}$$

□

By lemma 0.1 and the formula for the k -th derivative of a power series [RS02, p. 110] applied to the *geometric series* $\sum_{\nu=0}^{\infty} z^{\nu}$ we get

$$\frac{k!}{(1-z)^{k+1}} = \frac{d^k}{dz^k} \frac{1}{1-z} = \sum_{\nu=k}^{\infty} k! \binom{\nu}{k} z^{\nu-k} \quad (10)$$

for $k \in \mathbb{N}$. Dividing (10) by $k!$ yields

$$\sum_{\nu=k}^{\infty} \binom{\nu}{k} z^{\nu-k} = \frac{1}{(1-z)^{k+1}}. \quad (11)$$

Exercise 3.

(a) Consider the auxiliary function $\varphi : \mathbb{C} \rightarrow \mathbb{C}$ defined by

$$\varphi(z) := f(z) \exp(-z). \quad (12)$$

Clearly $\varphi \in \mathcal{O}(\mathbb{C})$ as a product of holomorphic functions. Furthermore by $f' = f$ we get

$$\varphi'(z) = f'(z) \exp(-z) - f(z) \exp(-z) = \varphi(z) - \varphi(z) = 0 \quad (13)$$

for any $z \in \mathbb{C}$. By [RS02, p. 55] φ is locally constant on \mathbb{C} and since \mathbb{C} is connected we have that φ is constant on \mathbb{C} (see [RS02, p. 35]). Since $f(0) = 1$ we have

$$\varphi(0) = f(0) \exp(0) = 1. \quad (14)$$

Thus $\varphi \equiv 1$ which yields

$$\exp(z) = 1 \cdot \exp(z) = \varphi(z) \exp(z) = f(z) \exp(-z) \exp(z) = f(z) \quad (15)$$

for all $z \in \mathbb{C}$.

(b) Differentiation of the addition formula with respect to w yields

$$g'(z+w) = g(z)g'(w). \quad (16)$$

for all $w, z \in \mathbb{C}$. Evaluating (16) at $w = 0$ gives

$$g'(z) = g(z)g'(0). \quad (17)$$

Define $\psi : \mathbb{C} \rightarrow \mathbb{C}$ by

$$\psi(z) := g(z) \exp(-g'(0)z). \quad (18)$$

Clearly $\psi \in \mathcal{O}(\mathbb{C})$ as a product of holomorphic functions. Similar to part (a) we get

$$\begin{aligned} \psi'(z) &= g'(z) \exp(-g'(0)z) - g(z)g'(0) \exp(-g'(0)z) \\ &= g(z)g'(0) \exp(-g'(0)z) - g(z)g'(0) \exp(-g'(0)z) \\ &= 0 \end{aligned}$$

for all $z \in \mathbb{C}$. Again ψ is constant on \mathbb{C} and with

$$g(0) = g(0+0) = g(0)g(0) \quad (19)$$

immediately follows $g(0) = 1$ by $g(0) \neq 0$. Thus $\psi(0) = 1$ and hence $\psi \equiv 1$ on \mathbb{C} which implies

$$g(z) = \exp(g'(0)z) = \exp(bz) \quad (20)$$

for $b := g'(0)$.

Exercise 4.

(a)

Proposition 0.1. For all $w, z \in \mathbb{C}$ holds:

$$\cos(w+z) = \cos w \cos z - \sin w \sin z \quad (21)$$

$$\sin(w+z) = \sin w \cos z + \cos w \sin z. \quad (22)$$

Proof. First we prove (21). We have

$$\begin{aligned} \cos w \cos z &= \frac{1}{4} (e^{iw} + e^{-iw}) (e^{iz} + e^{-iz}) \\ &= \frac{1}{4} (e^{i(w+z)} + e^{i(w-z)} + e^{i(z-w)} + e^{-i(w+z)}) \end{aligned}$$

and

$$\begin{aligned} \sin w \sin z &= -\frac{1}{4} (e^{iw} - e^{-iw}) (e^{iz} - e^{-iz}) \\ &= -\frac{1}{4} (e^{i(w+z)} - e^{i(w-z)} - e^{i(z-w)} + e^{-i(w+z)}) \end{aligned}$$

Thus

$$\cos w \cos z - \sin w \sin z = \frac{1}{2} (e^{i(w+z)} + e^{-i(w+z)}) = \cos(w+z). \quad (23)$$

Now we prove (22). We have

$$\sin w \cos z = \frac{1}{4i} (e^{iw} - e^{-iw}) (e^{iz} + e^{-iz})$$

$$= \frac{1}{4i} (e^{i(w+z)} + e^{i(w-z)} - e^{i(z-w)} - e^{-i(w+z)})$$

and

$$\begin{aligned} \cos w \sin z &= \frac{1}{4i} (e^{iw} + e^{-iw}) (e^{iz} - e^{-iz}) \\ &= \frac{1}{4i} (e^{i(w+z)} - e^{i(w-z)} + e^{i(z-w)} - e^{-i(w+z)}) \end{aligned}$$

Thus

$$\sin w \cos z + \cos w \sin z = \frac{1}{2i} (e^{i(w+z)} - e^{-i(w+z)}) = \sin(w+z). \quad (24)$$

□

(b)

(c) Let $z \in \mathbb{C} \setminus 2\pi\mathbb{Z}$. Then the index shift $\mu := \nu + n$ and application of the formula for the partial sum of a geometric series yields

$$\begin{aligned} \sum_{\nu=0}^n \cos(\nu z) &= \frac{1}{2} \sum_{\nu=0}^n (e^{i\nu z} + e^{-i\nu z}) \\ &= \frac{1}{2} + \frac{1}{2} \sum_{\nu=-n}^n e^{i\nu z} \\ &= \frac{1}{2} + \frac{1}{2} \sum_{\mu=0}^{2n} e^{i(\mu-n)z} \\ &= \frac{1}{2} + \frac{1}{2} e^{-inz} \sum_{\mu=0}^{2n} e^{i\mu z} \\ &= \frac{1}{2} + \frac{1}{2} e^{-inz} \frac{1 - e^{iz(2n+1)}}{1 - e^{iz}} \\ &= \frac{1}{2} + \frac{1}{2} e^{-inz} \frac{e^{iz(2n+1)} - 1}{e^{iz} - 1} \\ &= \frac{1}{2} + \frac{1}{2} e^{-inz} \frac{e^{-iz(n+1/2)}}{e^{-iz(n+1/2)}} \frac{e^{2iz(n+1/2)} - 1}{e^{iz} - 1} \\ &= \frac{1}{2} + \frac{1}{2} \frac{1}{e^{-iz/2}} \frac{e^{iz(n+1/2)} - e^{-iz(n+1/2)}}{e^{iz} - 1} \\ &= \frac{1}{2} + \frac{1}{2} \frac{e^{iz(n+1/2)} - e^{-iz(n+1/2)}}{e^{iz/2} - e^{-iz/2}} \\ &= \frac{1}{2} + \frac{1}{2} \frac{\sin(nz + z/2)}{\sin(z/2)} \end{aligned}$$
